System Overview

The J2 Network CRM runs on Ubuntu 24.04 and consists of:

- **CRM Frontend:** Web-based interface at `/var/www/jedapps.com/html/crm/`
- **API Backend:** Node.js application at `/home/ubuntu/Node.js_API/j2-api/`
- **Database:** PostgreSQL database named `j2network`
- **Web Server:** Nginx serving on port 80/443
- **Process Manager:** PM2 managing Node.js processes

Backup Types Explained

System Backup (Partial)

Size: ~56 MB | **Time:** 10-15 seconds

What's included:

- CRM files (HTML, CSS, JavaScript)
- API source code (without node_modules)
- Database schema (table structures only)
- Admin users data

- PM2 configuration
- Monitor state

Use case: Daily backups, quick recovery of files, version control

⚠ **Note:** This does NOT include environment variables, SSL certificates, or complete database. You'll need the existing server infrastructure to restore.

Disaster Recovery Backup (Complete)

Size: ~1.5 MB compressed (8 MB uncompressed) | **Time:** 30-60 seconds

What's included:

- Everything in System Backup PLUS:
- Complete database (all tables and data)
- Environment variables (.env with API keys)
- Nginx configuration
- SSL certificates (Let's Encrypt)
- SSH keys for RADIUS server access
- Automated RESTORE.sh script

Use case: Server migration, complete disaster recovery, rebuilding from scratch

Recommended: Create a Disaster Recovery backup at least once per week and before major changes.

Creating Backups

1 Access Backup Page

In your CRM, click **System Backup** from the left sidebar menu.

2 Choose Backup Type

Click either:

- **Create System Backup** — for quick daily backups
- **Create DR Backup** — for complete disaster recovery

3 Wait for Completion

System Backup: ~15 seconds | DR Backup: ~60 seconds

You'll see a success message with the backup size.

4 Download the Backup

The backup appears in the "All Backups" table. Click **Download** to save it to your computer.

Tip: Store backups in multiple locations: local computer, external drive, cloud storage (Google Drive, Dropbox).

Restoration Requirements

For System Backup Restoration

You need an **existing J2 Network server** with:

Component	Requirement
Operating System	Ubuntu 24.04 (already installed)
Node.js	Version 20.x (already installed)
PostgreSQL	Version 16+ (already installed)
Nginx	Latest version (already installed)
PM2	Latest version (already installed)
Access	SSH access with sudo privileges

For Disaster Recovery Restoration

You need:

Component	Requirement
Server	Fresh Ubuntu 24.04 server (can be completely blank)

RAM	Minimum 2 GB (4 GB recommended)
Disk Space	Minimum 20 GB free
Network	Internet connection
Access	SSH/root access (password or key)
Domain (optional)	DNS pointing to new server IP if changing servers

⚠ **Important:** The RESTORE.sh script will install everything automatically. You don't need to install Node.js, PostgreSQL, or any other software beforehand!

Restoring System Backup

Prerequisites: Existing J2 Network server with all software installed

1 Upload Backup to Server

From your computer, upload the backup file to the server:

```
scp 20260217_154818.tar.gz ubuntu@your-server-ip:~/
```

Windows users: Use WinSCP or FileZilla to upload the file to `/home/ubuntu/`

2 SSH into Server

```
ssh ubuntu@your-server-ip
```

3 Extract the Backup

```
cd ~  
tar -xzf 20260217_154818.tar.gz  
cd 20260217_154818
```

4 Restore CRM Files

```
sudo cp -r crm_backup/* /var/www/jedapps.com/html/crm/  
sudo chown -R www-data:www-data /var/www/jedapps.com/html/crm/
```

5 Restore API Files

```
cp -r j2-api_backup/* /home/ubuntu/Node.js_API/j2-api/  
cd /home/ubuntu/Node.js_API/j2-api  
npm install  
npx prisma generate
```

6 Restore Database (Optional)

Only if you need to restore admin users:

```
cd ~/20260217_154818  
sudo -u postgres psql j2network < admin_users_data.sql
```

7 Restart Services

```
pm2 restart all  
sudo systemctl restart nginx
```

8 Verify Restoration

Open your browser and go to: <https://jedapps.com/crm/>

Check that everything works correctly.

Restoring Disaster Recovery Backup

Use case: Building on a brand new server or recovering from complete system failure

⚠ **CRITICAL:** This will COMPLETELY rebuild your server. Only use on a fresh Ubuntu 24.04 installation or when recovering from disaster!

1 Provision Fresh Server

Create a new Ubuntu 24.04 server with:

- At least 2 GB RAM (4 GB recommended)
- 20 GB+ disk space
- SSH access enabled

Cloud providers: AWS EC2, DigitalOcean, Linode, Vultr all work great

2 Update DNS (If Changing Servers)

Point your domain `jedapps.com` to the new server's IP address.

Wait 5-15 minutes for DNS propagation.

3 Upload Backup to New Server

From your computer:

```
scp 20260217_155805.tar.gz ubuntu@NEW-SERVER-IP:~/
```

Windows: Use WinSCP/FileZilla to upload to `/home/ubuntu/`

4 SSH into New Server

```
ssh ubuntu@NEW-SERVER-IP
```

5 Extract Backup

```
cd ~  
tar -xzf 20260217_155805.tar.gz  
cd 20260217_155805
```

6 Make Restore Script Executable

```
chmod +x RESTORE.sh
```

7 Run the Automated Restore

```
sudo ./RESTORE.sh
```

When prompted, type **yes** and press Enter.

This will take 15-20 minutes and will automatically:

- Install Node.js, PostgreSQL, Nginx, PM2
- Restore all files
- Import complete database
- Configure SSL certificates
- Start all services

8 Verify Everything Works

After the script completes, run:

```
pm2 status  
curl http://localhost:3001/api/health
```

Then open your browser: <https://jedapps.com/crm/>

9 Configure PM2 Startup (First Time Only)

If this is a brand new server, configure PM2 to start on boot:

```
pm2 startup  
# Copy and run the command it shows you  
pm2 save
```

Success! Your entire system has been restored. All services, databases, configurations,

and files are now running on the new server!

Troubleshooting

Problem: "Permission denied" during restore

Solution: Make sure you're using `sudo` for commands that need it:

```
sudo ./RESTORE.sh
sudo cp -r crm_backup/* /var/www/jedapps.com/html/crm/
```

Problem: "npm install" fails

Solution: Make sure Node.js is installed:

```
node --version
npm --version
```

If not installed, run:

```
curl -fsSL https://deb.nodesource.com/setup_20.x | sudo -E bash -
sudo apt install -y nodejs
```

Problem: Database restore fails

Solution: Check PostgreSQL is running:

```
sudo systemctl status postgresql
sudo systemctl start postgresql
```

Problem: Nginx shows "502 Bad Gateway"

Solution: Check if API is running:

```
pm2 status
pm2 logs j2-api
```

Restart if needed:

```
pm2 restart j2-api
```

Problem: SSL certificates don't work after restore

Solution: If you changed domains, regenerate certificates:

```
sudo certbot --nginx -d jedapps.com
```

Problem: Can't SSH into new server

Solution: Check:

- Firewall allows port 22: `sudo ufw allow 22`
- Security group allows SSH (cloud providers)
- Using correct IP address
- SSH key is correct

Still Having Issues?

Get Help:

- Check API logs: `pm2 logs j2-api`
- Check Nginx logs: `sudo tail -f /var/log/nginx/error.log`
- Check system logs: `sudo journalctl -xe`
- Contact your system administrator

You're all set! You now know how to backup and restore your J2 Network CRM system. Remember to create regular backups and test your restore process periodically!
